

THE PROBLEM

Fragmentation and proliferation of sustainability-disclosure demand

looks scattered and ever-growing on the surface, converges underneath

TWO PARALLEL SCANS — NEITHER SUFFICIENT ON ITS OWN

1

STEP 1

Scan the ecosystem

What do the instruments demand?

**49 catalogued instruments,
30 placing a scorable demand**

2

STEP 2

Scan the peers

What do other players report on?

**70 ESRS requirements,
63 reported by at least one firm**

3

STEP 3 — OVERLAP

Cross instruments × topics

A handful of core topics already covers most of both

Instruments satisfied
by the core topics

Topics carrying
any demand

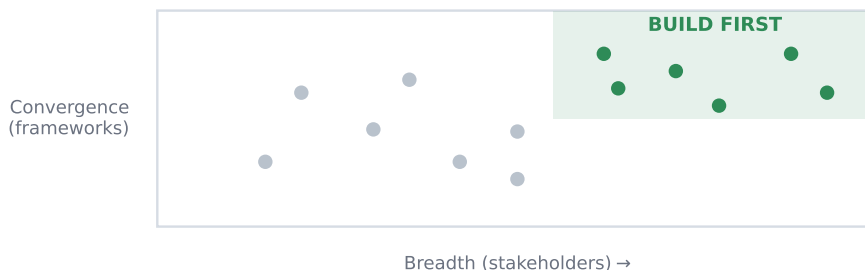

build the core once, cover most of what is asked

4

STEP 4 — TOOL

Build the tool

Stage the surviving topics by convergence × breadth

(illustrative — not the thesis's Chapter 6 figure)

Result: a 4-topic core for every firm

plus 1 more for wild-capture, 4 for aquaculture, 5 for mixed sourcing
