

Chapter 5 — supporting files

Build Once, Answer Many: Where Disclosure Demand Converges for European Seafood-Processing SMEs

Linne Verhoeven · EPFL, August 2026

Chapter 5 of the attached draft begins on page 28. Everything reported in that chapter derives from the two accompanying files, which form a single chain:

File	Role
ESRS_Coverage_Analytics_v7.ipynb	Builds the coverage matrix from the coded reports
ESRS_Coverage_Results.xlsx	The results as they appear in Chapter 5

The underlying per-firm coding workbook is available on request.

The results file

ESRS_Coverage_Results.xlsx opens on a README sheet describing all eleven tabs. The headline coverage rates, reproduced in Table 1 of Chapter 5, are as follows.

Company	Disclosure requirements reported (of 70)	Coverage
Thai Union	53	75.7%
Bolton	45	64.3%
Nomad Foods	42	60.0%
Profand	39	55.7%
Espersen	34	48.6%
Mowi	33	47.1%

Thirteen disclosure requirements are reported by all six firms. This set forms the universal core discussed in the chapter.

The notebook

ESRS_Coverage_Analytics_v7.ipynb is written for Google Colab and runs in seventeen cells. All outputs are saved within the file, so every chart and table can be read without executing anything.

What the analysis does and does not claim

- It measures ESRS-aligned coverage in practice, coded from published reports. It is not an assessment of legal ESRS compliance.

- Coverage is recorded as binary presence at requirement level. It therefore measures breadth, not depth, quality or assurance: a topic addressed in a single sentence and one addressed exhaustively both score equally.
- The six firms were selected purposively as the sector's most advanced reporters, not as a representative sample. Nothing here describes typical practice.
- A lower coverage figure may reflect a different production system, reporting framework or reporting year rather than weaker sustainability performance. No ranking of the six firms is intended.
- Three firms report under the ESRS and three under the GRI Standards. The GRI disclosures were bridged onto the ESRS structure using the GRI-EFRAG interoperability mapping. That bridge rests on analyst judgement, which is the principal reason your review is valuable.
