Build Once, Answer Many: Where Disclosure Demand Converges for European Seafood-Processing SMEs

Linne Verhoeven · supervised by Prof. Jean-Philippe Bonardi · in collaboration with Seafood Europe · August 2026

This archive contains the ten analysis files underlying the thesis. They correspond to the index in Appendix H. Each workbook opens on a README, INSTRUCTIONS or Legend sheet describing its contents.

Chapter 4 — The disclosure ecosystem

Necessity_Domain_Matrix_v8.xlsx contains the catalogue of 49 instruments, each classified by necessity tier, domain, stakeholder source and obligation locus. The Classification sheet is the source of the counts reported in Chapter 4: 26 scored instruments plus 4 firm-profile opt-ins give the 30 that enter the demand matrix, alongside 7 context instruments, 11 exclusions and 1 baseline.

Chapter 5 — The cohort frontier

Three files form a single chain, in this order:

File	Role
ESRS_KPI_Mapping_V9.xlsx	Raw coding of each firm's report at disclosure-requirement level
ESRS_Coverage_Analytics_v7.ipynb	Builds the coverage matrix from that coding
ESRS_Coverage_Results.xlsx	The results reported in Chapter 5

In ESRS_KPI_Mapping_V9.xlsx, only the ESRS_MASTER and Mapping_ALLStacked_TU_N25 sheets feed the published results. The per-firm sheets and earlier scenario variants are retained so that the coding history remains inspectable.

ESRS_Coverage_Analytics_v7.ipynb is written for Google Colab and runs in seventeen cells. All outputs are saved within the file, so every chart and table can be read without executing it.

GRI_ESRS_v6.xlsx and GRI_ESRS_Mapping_v4.ipynb implement the GRI-to-ESRS bridge. This is required because three cohort firms report under the GRI Standards rather than the ESRS, and to differing degrees: Thai Union reports in accordance with the standards, while Nomad Foods and Profand report with reference to them. Sheets are grouped by company.

Chapter 6 — Cross-framework demand mapping

File	Contents
Phase3_Coverage_Matrix_v17.xlsx	The scored matrix: 32 topic rows against 31 instrument columns, giving 992 cells of which 181 carry demand, with a per-cell justification log
GRI_13_Topics_FINAL.xlsx	GRI 13's 26 material topics classified against the ESRS as Covered, Reporting

File	Contents
	gap or Structural gap; the source of the four sector-material rows
VSME_Basic_and_Comprehensive.xlsx	VSME datapoints, used for the proportionate-subset crosswalk
SME_Datapoint_Guide.xlsx	113 datapoints across 32 topics, each with a plain-language reading and a first collection step; the data layer beneath the diagnostic tool

Notes on the analysis

The coding rests on a single analyst's documented judgement. Every non-zero cell carries a recorded rationale and a citation to the source clause, but the material has not been independently double-coded. The member-checking round with the six cohort firms has been initiated and remains outstanding at the time of writing; Sections 3.3 and 7.6 of the thesis state this explicitly.

This is the canonical set. Superseded versions, duplicate working copies and temporary files have been removed.
