

THE PROBLEM

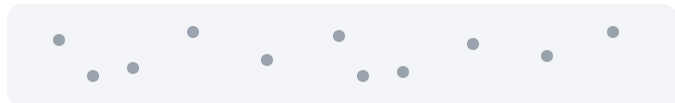

Apparent fragmentation

of sustainability-disclosure demand
looks scattered on the surface, converges underneath

TWO PARALLEL SCANS — NEITHER ONE ALONE IS MANAGEABLE

1 STEP 1 Scan the ecosystem

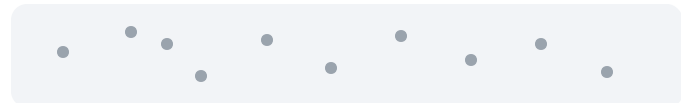

What do the instruments demand?

→ 30+ instruments — unpack them all, countless topics

2 STEP 2 Scan the peers

What do other players report on?

→ dozens of topics, covered unevenly by peers

3 STEP 3 — OVERLAP Cross instruments × topics

A handful of core topics already covers most of both

Instruments

satisfied by the core topics

Topics

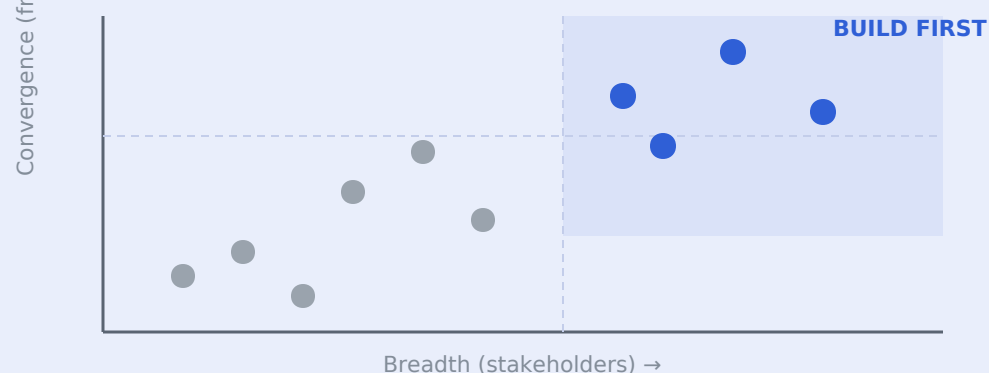

satisfied

= build the core once, cover most of what's asked

(proportions illustrative)

4 STEP 4 — TOOL Build the tool

Stage the surviving topics by convergence × breadth

Breadth (stakeholders) →
(illustrative — not the thesis's actual Chapter 7 figure)

Result: a 4-topic core for every firm — plus 4-5 more for wild-capture, aquaculture, or both
